

What is claimed is:

1. A software updating system, comprising:

5 a plurality of update data supplying apparatuses for supplying  
update confirmation information regarding the presence or absence of  
updates for predetermined software via a network;

an electronic device for executing a process in accordance with said  
update confirmation information supplied from said update data  
supplying apparatus, wherein

10 said electronic device includes:

judging means for judging whether or not, among installed  
software, there exists software for which the presence of updates needs to  
be confirmed;

15 detection means for detecting said update data supplying  
apparatus to which an inquiry is to be made on the presence of updates for  
said software for which said judging means has judged a confirmation to  
be necessary;

inquiring means for making an inquiry on the presence of  
updates for said software to said update data supplying apparatus  
20 detected by said detection means; and

execution means for executing a process based on said  
update confirmation information supplied from said update data  
supplying apparatus in response to said inquiry made by said inquiring  
means, and

25 said update data supplying apparatus includes:

confirmation means for confirming the presence or absence  
of updates for said software regarding which there was an inquiry on the  
presence of updates by said inquiring means of said electronic device; and

30 supplying means for supplying to said electronic device  
said update confirmation information in accordance with a confirmation  
result by said confirmation means.

2. The software updating system according to claim 1, wherein said update confirmation information is one of update data for updating said software and information indicating the presence or absence of updates.

5

3. The software updating system according to claim 1, wherein said electronic device further comprises storage means for storing an update confirmation cycle for said installed software, and

said judging means judges whether or not, among said installed software, there exists software for which the presence of updates needs to be confirmed based on said update confirmation cycle.

10

4. The software updating system according to claim 1, wherein said judging means of said electronic device judges all of said installed software to be software for which the presence of updates needs to be confirmed when a predetermined event occurs.

15

5. The software updating system according to claim 4, wherein said event is one of the turning on of the power of said electronic device and the arrival of a predetermined time.

20

6. The software updating system according to claim 1, wherein after said update data supplying apparatus is detected by said detection means, said inquiring means of said electronic device waits until a predetermined time and makes an inquiry on the presence of updates for said software.

25

7. An information processing apparatus which executes a process in accordance with update confirmation information supplied from a plurality of update data supplying apparatuses that supply via a network said update confirmation information regarding the presence or absence of updates for predetermined software, comprising:

30

judging means for judging whether or not, among installed software, there exists software for which the presence of updates needs to be confirmed;

5 detection means for detecting said update data supplying apparatus to which an inquiry is to be made on the presence of updates for said software for which said judging means has judged a confirmation to be necessary;

10 inquiring means for making an inquiry on the presence of updates for said software to said update data supplying apparatus detected by said detection means; and

execution means for executing a process based on said update confirmation information supplied from said update data supplying apparatus in response to said inquiry made by said inquiring means.

15 8. An information processing method of an information processing apparatus which executes a process in accordance with update confirmation information supplied from a plurality of update data supplying apparatuses that supply via a network said update confirmation information regarding the presence or absence of updates for  
20 predetermined software, comprising the steps of:

judging whether or not, among installed software, there exists software for which the presence of updates needs to be confirmed;

25 detecting said update data supplying apparatus to which an inquiry is to be made on the presence of updates for said software for which a confirmation has been judged to be necessary in said judging step;

making an inquiry on the presence of updates for said software to said update data supplying apparatus detected in said detection step; and

30 executing a process based on said update confirmation information supplied from said update data supplying apparatus in response to said inquiry made in said step of making said inquiry.

9. A recording medium in which is recorded a computer readable program for an information processing apparatus which executes a process in accordance with update confirmation information supplied from a plurality of update data supplying apparatuses that supply via a network said update confirmation information regarding the presence or absence of updates for predetermined software, said program comprising:

5 a judging control step for controlling the judgment as to whether or not, among installed software, there exists software for which the presence of updates needs to be confirmed;

10 a detection control step for controlling the detection of said update data supplying apparatus to which an inquiry is to be made on the presence of updates for said software for which a confirmation has been judged to be necessary in said judging control step;

15 an inquiry control step for controlling the making of an inquiry on the presence of updates for said software to said update data supplying apparatus detected in said detection control step; and

20 an execution control step for controlling the execution of a process based on said update confirmation information supplied from said update data supplying apparatus in response to said inquiry made in said inquiry control step.

10. A program for an information processing apparatus which executes a process in accordance with update confirmation information supplied from a plurality of update data supplying apparatuses that supply via a network said update confirmation information regarding the presence or absence of updates for predetermined software, wherein said program makes a computer execute a process, comprising:

25 a judging control step for controlling the judgment as to whether or not, among installed software, there exists software for which the presence of updates needs to be confirmed;

30 a detection control step for controlling the detection of said update

data supplying apparatus to which an inquiry is to be made on the presence of updates for said software for which a confirmation has been judged to be necessary in said judging control step;

an inquiry control step for controlling the making of an inquiry on the presence of updates for said software to said update data supplying apparatus detected in said detection control step; and

an execution control step for controlling the execution of a process based on said update confirmation information supplied from said update data supplying apparatus in response to said inquiry made in said inquiry control step.

11. A software updating system, comprising:

a plurality of update data supplying apparatuses for supplying update confirmation information regarding the presence or absence of updates for predetermined software via a network;

a first electronic device for executing a process in accordance with said update confirmation information; and

a second electronic device for supplying to said first electronic device said update confirmation information supplied from said update data supplying apparatus, wherein

said first electronic device includes:

judging means for judging whether or not, among installed software, there exists software for which the presence of updates needs to be confirmed;

detection means for detecting said update data supplying apparatus to which an inquiry is to be made on the presence of updates for said software for which said judging means has judged a confirmation to be necessary;

request means for making a request to said second electronic device to make an inquiry to said update data supplying apparatus detected by said detection means on the presence of updates for

said software; and

execution means for executing a process based on said update confirmation information supplied from said second electronic device in response to said request made by said request means,

5       said second electronic device includes:

inquiring means for making an inquiry, in response to said request made by said request means of said first electronic device, on the presence of updates for said software to said update data supplying apparatus detected by said detection means; and

10       first supplying means for supplying to said first electronic device said update confirmation information supplied from said update data supplying apparatus in response to said inquiry made by said inquiry means, and

      said update data supplying apparatus includes:

15       confirmation means for confirming the presence or absence of updates for said software regarding which there was an inquiry on the presence of updates by said inquiring means of said second electronic device; and

20       second supplying means for supplying to said second electronic device said update confirmation information in accordance with a confirmation result by said confirmation means.

## ABSTRACT OF THE DISCLOSURE

It is made possible to update installed software appropriately. A CE device stores an update management table in which are set, with  
5 respect to software bundled with the CE device, the names, IDs, version numbers, update cycles, and contact information (URLs of update data supplying servers) for making inquiries on the presence of updates. For example, assuming that everyday, when it is recognized that the time is past 10:00, there is a need to check for the presence of updates for  
10 software A, the CE device accesses a URL corresponding to software A, and makes an inquiry on the presence of updates.
